

## What's new

### To the customers who are using the static eliminator

The static eliminator generates high voltage inside the unit.

When using the present/discontinued product, please do maintenance such as cleaning inside. If the maintenance has not been done enough, the insulation would be reduced, which might cause a dangerous situation such as smoke, fire and so on.

As for the maintenance, please clean the foreign material such as dust, which is on the filter, discharge electrode, and so on. When the unit is used at the unattended place or for a prolonged time, please check if there's no unusual odor/sound or smoke more than once a day. Also, when measured the ion balance by FG-450 etc, and found out the abnormality, please contact us or the nearest dealer.

Please download the instruction manual for the maintenance
